# Southwest University

"Introduction to Web Development" Experiment Report

School：**School of Computer & information Science**

Major：**Software engineering**

Class： **4**

Name： 方承煜

Student Number： **222020321062095**

Experiment Report 1

No.1:Objective: Main：Learn and master the ＜div＞box and CSS related functions 1. Using ＜div＞ and CSS to build the film website made before 2. Making a 960 pixel wide 12 column grid website with CSS
No.2:Detailed requirements: 1. On the basis of the information of the original video website, by creating multiple ＜div＞ boxes, and using CSS forms to control the length, width and color background of these ＜div＞ boxes, it can ensure the practicability and be more beautiful at the same time. Ex1：A film information website 2. Create a blank page, link 960＿ 12＿ col.css Through the self-defined CSS table and 960.gs 12 column CSS form, make a multi row and multi column website framework, and mark its width information in each grid. Ex2：A 960px 12col website framework Matters needing attention: 1. Try to use the content learned in the class as much as possible, and use more diversified code and elements to make the web page more practical and beautiful. 2. As far as possible to ensure that the code syntax is correct and has a higher readability.

No.3:Procedure:

Ex1[Website Code]

No.5:Analysis：

For Ex1：The first work of this experiment is to use the ＜
div ＞ box and CSS table to reconstruct the previous video

website. Since I have already used < div > and CSS in the previous website, I only optimize the code and content based on the previous one, which increases the syntax correctness of the code, and optimizes the website by using elements not used before Interface. Here are some summaries.

1. In order to better control the elements of web pages in a more customized way, I use the < div > box nesting method, and define different classes for different < div > in CSS, so as to manage and control the contents of each part more finely.

```
<div class="a1">
  <div class="a2">
    <div class="a3">
    </div>
  </div>
</div>
```

2. If you don't want content close to the edge of < div >, you can fill the outer ring of < div > by setting "padding" in CSS.

```
padding:5px 0 5px 29px;
```

3. If you want to make multiple blocks that are originally exclusive to one row, you can use "display: inline block;" in CSS for control, or "float" to make them float

4. For positioning elements, you can use the position statement in CSS. The default value of this item is "static" without positioning. Absolute positioning element can be generated by using absolute positioning, which is positioned relative to the first parent element other than static positioning. Use "fixed" to generate an absolute positioning element relative to the browser window, "relative" to generate a relative positioning element relative to its normal position, and "inherit" to inherit the value of "position" of the parent element.

For Ex2: The second task of this experiment is to make a 960px 12col website framework. In this experiment, I tried as many as possible for the block arrangement, and used a lot of CSS to beautify the page. My summary of this experiment is as follows:

1. For the beautification of the website, we should choose more appropriate color scheme according to the color science as far as possible, so that the whole webpage looks more beautiful.

2. If you need to modify the font, you can modify it by "font family" in CSS, and control the font size by modifying "font size".

    font-family: Gotham, "Helvetica Neue", Helvetica, Arial, "sans-serif";
    font-size: 10px;

3. If you want to add fillets to < div >, you can use "border radius" to control the radius of fillets in the CSS form.

    border-radius: 12px;

4. For the control of paragraph line height and word spacing, use "line height;" and "letter spacing" in CSS respectively.

    line-height: 100%;
    letter-spacing: 2px;

5. Due to "960"_ 12_ col.css " The width of the column is controlled only in CSS, but the height of the block is not controlled. It is necessary to add height control in CSS to adjust the height of the block.

6. If you want a block of the same row to start with a non first column, you can use "push" in the class_ Column number "to move the block to the right by a certain number of columns

7. In the class of global maximum framework < div >, we should use "Clearfix" to clear the float and solve the problem of height collapse.

8. Use "prefix" respectively_ Column number "and" suffix "_ Number of columns "to control how many columns are left blank on the left and right

sides of the block.

9. If you don't want floating elements to appear on the left / right / both sides of the block, use "clear" to control it.

clear:both/left/right

Summary:

Through this experiment, I learned and mastered the operation skills of < div > box and CSS, learned 960px 12col web design framework rules, mastered the programming and writing ability of HTML and CSS code, and enhanced the design ability and aesthetic ability of webpage. Can do more handy control the size, location, appearance and other factors of web page elements. My web page production ability has improved to some extent, but I believe that after that, I can do better.
